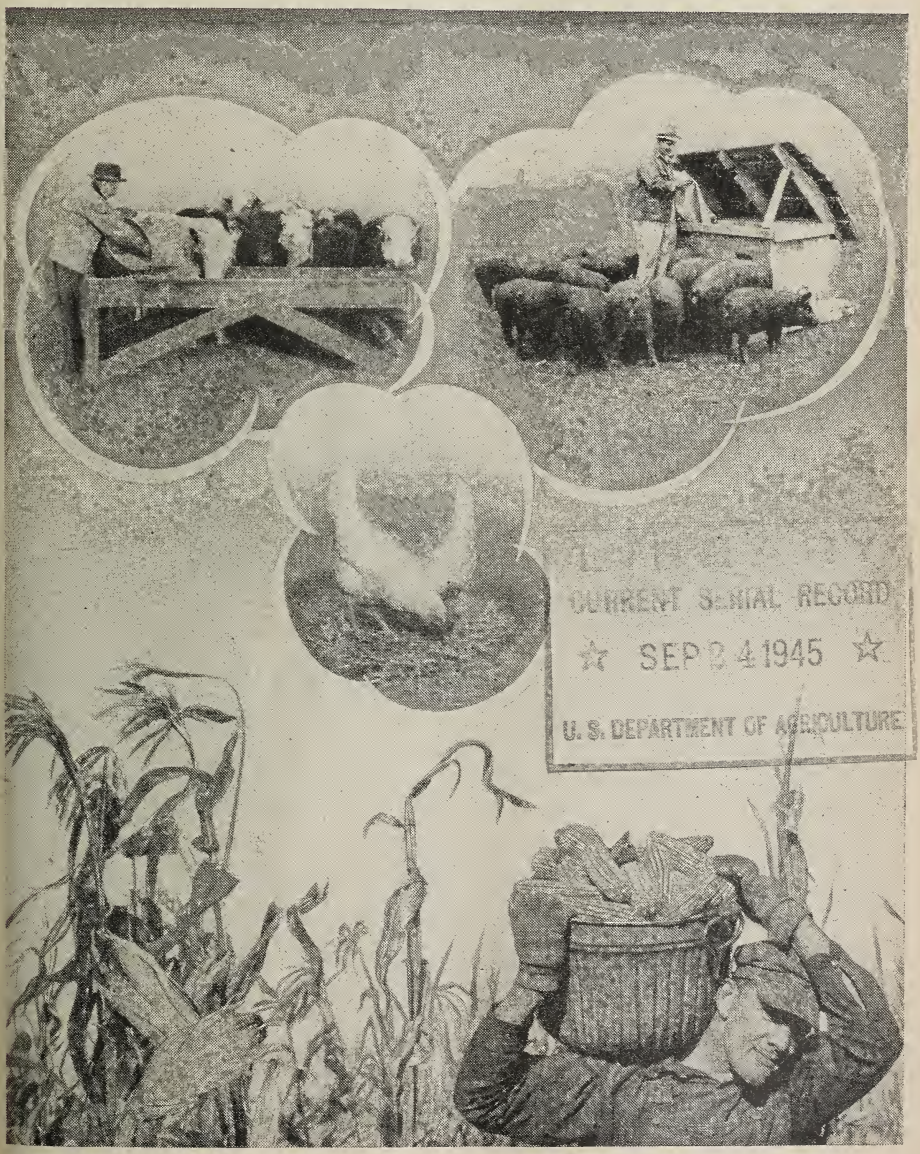
WARTIME SHIFTS IN FEED AND LIVESTOCK PRODUCTION



CURRENT SERIAL RECORD
☆ SEP 24 1945 ☆
U. S. DEPARTMENT OF AGRICULTURE

UNITED STATES DEPARTMENT OF AGRICULTURE

This publication on shifts in livestock and feed production during the war is based on a report originally prepared during the summer of 1944 and printed for the use of Agricultural Adjustment Agency administrative personnel. The unfavorable feed-grain situation that developed in the summer of 1943 and continued until the 1944 harvest of small grains aroused wide interest in the subject.

From the Corn Belt, where feed supplies are generally adequate, inquiries have come regarding the increased production of livestock and poultry in areas where farmers normally depend on the Corn Belt for part of their feed requirements. From feed-deficit areas have come requests for information regarding increased livestock production in the Corn Belt.

Requests for information about wartime production of feed and livestock on a local area basis have been received (1) from farmers and other general readers who sought a popular, nontechnical explanation of the situation, and (2) from educators and agricultural specialists who wished the most complete statistical data that could be readily compiled.

This publication is designed to meet the needs of both groups. The text is for the general reader. The tables furnish detailed data regarding wartime shifts in production of all classes of livestock and of the principal feed grains in all regions and all States.

This publication supersedes Wartime Shifts in Feed and Livestock Production with Local Area Comparisons, ACP No. 145, issued for administrative use, July 1944.

WARTIME SHIFTS IN FEED AND LIVESTOCK PRODUCTION

By Worley S. Earp, *Agricultural Economist,* and Eileen McDonald, *Agricultural Economist, North Central Division, Agricultural Adjustment Agency*

WARTIME PRODUCTION RECORD

American farmers, as part of their war job, have produced more livestock and poultry since 1940 than during any other 4-year period. In response to war needs, they have raised record numbers of hogs, cattle, and chickens. They have produced record quantities of milk and eggs. While doing all this, they also were increasing tremendously their production of food and oil crops. All in all, their achievements during this war are perhaps the greatest ever performed by the farmers of any country.

Food production has risen steadily throughout the war period reaching, in 1944, a level 37 percent above the 1935-39 average. The average production of food for the 3 years 1942, 1943, and 1944 is 31.3 percent higher than this pre-war level. Food output is now running 45 percent above the average for the 1920's and about 58 percent above the 1917-18 period of the last war.

Farmers not only have increased the total volume of food produced but also have increased the food items that people need most. For one illustration, the yearly production of milk has jumped from about 70 billion pounds in the last war to about 119 billion pounds in this war.

Because grain production did not keep pace with livestock and poultry production during the first 3 years and because of difficulties in transportation, grain became scarce in many areas during late 1943. This situation was not eased until the harvest of small grains in 1944.

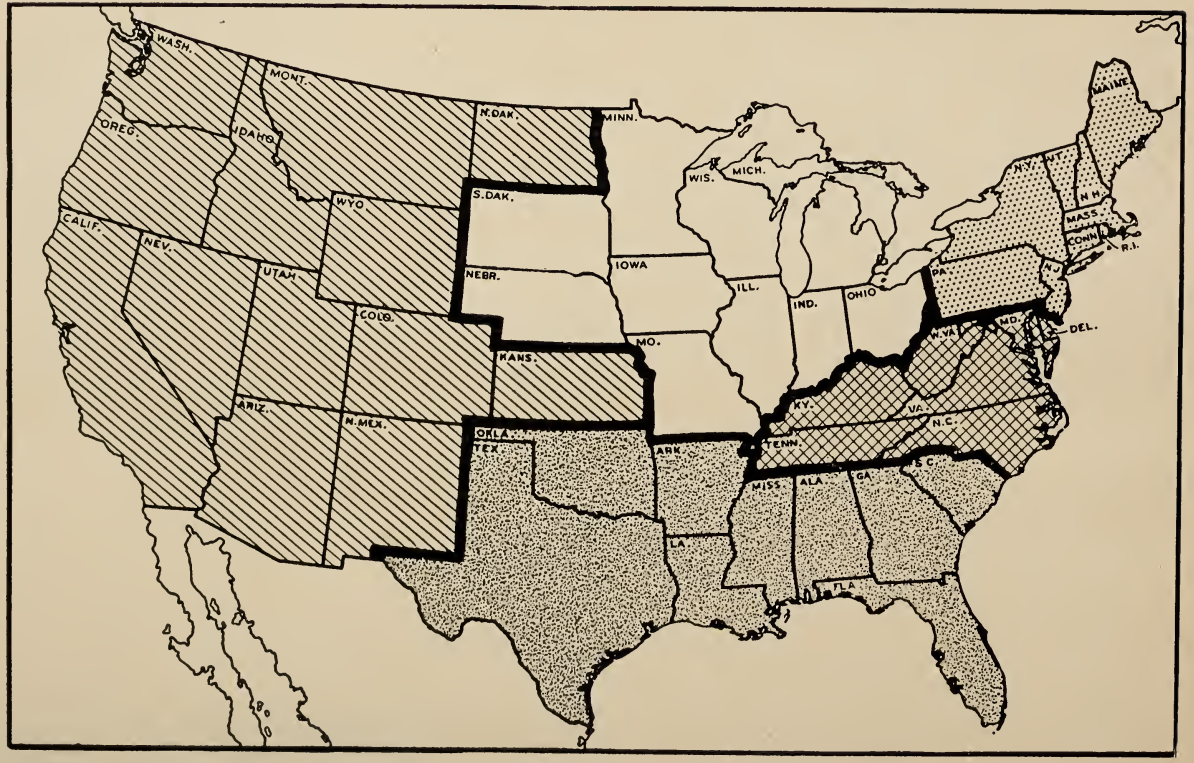
Hay shortages also developed in some areas where drought hit in the summer of 1943 and again in the summer of 1944.

The greatly increased production of livestock and poultry during the war was made possible by vast reserves of feed grains that had been built up before the war in the Ever-Normal Granary. These reserves were stored in elevators and farm bins, mostly under Government loan, in the years when this country was producing more grain than its livestock and poultry needed. One purpose of this storage was to make sure that in time of need, whether a drought, crop failure, or a war, the Nation's farm animals could be fed.

During the war years up to 1944, American farmers were feeding more feed grain than was available from current production after deductions were made for industrial purposes.

As a result, by the end of 1943, the Ever-Normal Granary was practically empty, except for some wheat. With no more reserves of feed grains to draw on, farmers during 1944 had to depend on current production and large quantities of wheat for feeding their livestock and poultry. This situation was eased by the harvest of a record corn crop in 1944, together with a drop in the 1944 pig crop.

AGRICULTURAL ADJUSTMENT AGENCY REGIONS



FEED-SURPLUS AND FEED DEFICIT AREAS

While every State produces feed grain, many States, even in normal times, produce less than their livestock and poultry consume. In fact, few States outside of the Corn Belt produce enough feed for their own requirements. Farmers in these areas, known as feed deficit areas, depend on shipments from feed surplus areas, primarily the Corn Belt, and on imports for a large part of their feed requirements. Farmers in feed surplus areas depend for part of their income on the sale of the grain they produce in excess of the quantity used locally in the production of livestock and poultry.

Corn, grown in every State, supplies about three-fourths of the Nation's feed grain. Seventy-five percent of the Nation's supply of corn and oats, the two major feed crops, is produced in the Corn Belt.

The Northeast, East Central and Southern Regions normally produce less feed grain than is required for their livestock and poultry feeding. Ordinarily 40 percent of the feed grain requirements for the Northeast States is shipped in from the Corn Belt or imported. Smaller proportions of the total feed grain requirements move from the Corn Belt into the East Central and Southern regions. See map of Agricultural Adjustment Agency regions facing this page.

Although detailed information on commercial movement of feed grains is inadequate to make a reasonable estimate of the State-by-State movement, we have attempted by means of feed balance tables to indicate the quantities of feed grains, including wheat and rye, which were required to accomplish the wartime expansion in livestock and poultry production for the country as a whole.

NATIONAL FEED BALANCE

The feeding year runs from October 1 through the following September 30. During the 1941-42 feeding year, more than 2.5 billion bushels of corn and a little over 1.5 billion bushels of small grain, which included 183.2 million bushels of wheat, were fed to livestock.

During the 1942-43 feeding year, livestock and poultry consumed more grain than in any previous year. Nearly 3 billion bushels of corn and more than 2 billion bushels of small grains (including 414 million bushels of wheat) were used as feed. This was about 23 percent more grain than was used for feed the previous year. Such a large increase was possible only because of the Ever-Normal Granary stocks that had been built up in peacetime. Virtually all the reserves of corn were used up by the end of September 1943 as a result of increased numbers of livestock.

Somewhat less grain was fed to livestock and poultry during the 1943 44 feeding year. Preliminary estimates indicated the total was about 2.9 billion bushels of corn and about 1.9 billion bushels of small grain (including about 444 million bushels of wheat). The largest reductions occurred in oats and barley, as there was a quarter of a billion bushels less oats and barley used as feed in 1943-44 than the previous year. The relative shortness of the feed supply forced a sharp cut in hog production.

During the war, the quantity of protein concentrates, mill byproducts, and miscellaneous products used for livestock feed increased 11 percent. The biggest increase was in soybean meal. This general increase was largely a result of the need for greater production of vegetable oils in the United States to replace normal sources of imported oils cut off early in the war.

HOGS

Farmers increased hog production phenomenally in the 3 years from 1941 through 1943. On January 1, 1944, there were nearly 84 million hogs on U. S. farms, the greatest number at the start of any year in the Nation's history. This was about 30 million hogs, or 54 percent, more than the number on January 1, 1941. This record was achieved even though more hogs were slaughtered during 1943 than during any previous year.

In response to the Government's call for more pork, farmers in all parts of the country stepped up hog production. The greatest relative increase—82 percent—was in the Western Region. The North Central Region (the Corn Belt) came next with a 58 percent increase. This region produces 65 percent of all the hogs normally raised in the United States.

While the increase was greatest in the two regions of ample feed supplies, it was by no means confined to them. Hog numbers in the feed-deficit areas also increased notably—41 percent in the East Central Region, 40 percent in the Northeast Region, and 38 percent in the Southern Region.

For the country as a whole, 44 percent more pigs were saved in 1943 than in 1941. The 1943 pig crop of 121.7 million head, the largest in history, resulted in a hog population considerable larger than available feed supplies could support and still meet the needs of other livestock. Realizing this, farmers reduced farrowings in 1944 to bring hog numbers more in line with feed supplies. The 1944 pig crop was about 29 percent less than the all-time record of 1943, but still 2 percent greater than that of 1941.

The greatest decrease in pig crops occurred in the Corn Belt and the Western Region, where adequate feed supplies are available, rather than in the feed-deficit areas of the South and East.

By January 1, 1945, the number of hogs had been reduced to about 60 million, approximately 12 percent above the January 1, 1941, number.

CATTLE

The cattle population of the United States on January 1, 1944, was the largest in history, more than 82 million head. Since 1939 it had been growing at the rate of more than 3 million head a year. The previous peaks, reached in 1934 and 1918, were 8 and 9 million head, respectively, below the 1944 mark.

To make it easier to compare changes in cattle numbers, cattle have been considered as two classes: (1) Dairy cattle, including all cows and heifers 2 years old and over kept for milking, and (2) other cattle, including all beef cattle and calves, and cattle of dairy breeds not kept for milking.

DAIRY CATTLE

The number of dairy cattle has been increasing steadily since 1938 On January 1, 1945, there were 27.8 million head in the United States, which is up about 13 percent from January 1, 1938, and about 9 percent from January 1, 1941.

Milk production also has increased, but not in proportion to dairy cattle numbers. It is estimated that 1944 production is somewhat above that of 1943, or about 119 billion pounds. That would be about 11 percent more than the 1938 total of 106 billion pounds and 3 percent more than the 1941 total of 115 billion pounds.

The largest increase in both dairy cattle and milk production between 1941 and 1944 occurred in the East Central Region—12 percent and 8 percent, respectively. The Southern Region came next, with dairy cattle up about 11 percent and milk production up about 4 percent. Smaller changes in both numbers and milk output occurred in the North Central and Western Regions. In the Northeast Region dairy cattle numbers increased only about 2 percent and milk production decreased slightly between 1941 and 1944.

The January 1, 1945, numbers of dairy cows indicated a slight increase over 1944 numbers. It is expected that this increase will be reflected in 1945 milk production.

OTHER CATTLE

The number of other cattle in the United States increased nearly 19 percent between January 1, 1941, and January 1, 1944. Numerically the increase was 8.7 million head.

In the Corn Belt, where the number of cattle had been rising since 1938, the increase during 1943 alone was over a million head. This increase tended to cut down the demand in the Corn Belt and in areas of Plains States adjacent to the Corn Belt for feeder cattle from the range areas.

In the Great Plains States, including North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, and Texas, where the cattle cycle is most pronounced, the number of other cattle on farms and ranches about equals the peak carrying capacity of range and pasture under the most favorable grazing conditions. The increase in that area was about 24 percent between January 1, 1941, and January 1, 1944. Numerically, it was from 14.4 million to 17.8 million head.

Other cattle numbers increased over the 3-year period in every State except Maine. During this period the greatest relative increase, about 45 percent, was in South Dakota. Montana, up 43 percent, was second and North Dakota, up 42 percent, was third.

A 2-percent decrease occurred in numbers of cattle other than dairy cows during 1944, as is evident in the January 1, 1945, number of 53,975,000. However, South Dakota and North Dakota continued to increase other cattle numbers to 55.7 percent and 47.8 percent, respectively, above 1941 numbers.

Throughout the South, and generally east of the Mississippi River, cattle have increased to record numbers in nearly every State.

POULTRY

Production of the three principal classes of poultry—hens and pullets, commercial broilers, and turkeys—increased markedly from 1941 through 1943. This was true of egg production as well. A considerable decrease occurred during 1944 in chicken and broiler numbers, but the number of turkeys has increased.

HENS AND PULLETS, AND EGG PRODUCTION

During the first 5 months of 1944, about 35 percent more hens and pullets and about 44 percent more eggs were produced than during the first 5 months of 1941. The mild winter, together with better care and management of flocks, caused hens and pullets to lay at an unprecedented rate. Total production of 2.5 billion dozen eggs during this flush season taxed marketing and storage facilities and the Government had trouble to support farm egg prices at the announced minimums.

During the feeding year that began October 1, 1943, egg production was 39 percent greater than during the 1940-41 feeding year.

The greatest relative increase in hens and pullets, about 41 percent, took place in the Southern Region, where egg production increased about 40 percent. The greatest increase in egg production, about 44 percent, occurred in the North Central Region, where the number of hens and pullets increased about 35 percent.

In the North Central Region, 227 million of the 519 million hens and pullets in the United States laid 26 billion of the national production of 57 billion eggs.

Increases, both in hens and pullets and in egg production, occurred in all States over the 3-year period. Despite the fact that considerable liquidation of hens and pullets occurred in the latter part of 1944, only two States, Florida and Arizona, had fewer hens and pullets at the start of 1945 than were on farms at the beginning of wartime production in 1941.

CHICKENS RAISED

About 30 percent more chickens were raised in 1943 than in 1941. The number of chickens raised in 1944, while considerably below the 1943 wartime peak, was about 5 percent greater than in 1941. More chickens were raised in 1944 than in 1941 in all regions except the Southern, where the number raised was 3 percent lower. However, the southern States of Alabama, Georgia, Mississippi, and South Carolina raised more chickens than in 1941.

COMMERCIAL BROILERS

Commercial broiler production has increased substantially during the war in all areas where chickens are raised for the broiler market. The peak was reached in 1943, about 46 percent above 1941.

The greatest relative increase of broilers in 1943, 58 percent above 1941, occurred in the Southern and Western Regions. The Northeast Region was next with an increase of 53 percent. Increases in other regions were: East Central, 40 percent, and North Central, 36 percent. Numerically the greatest increase was in the East Central Region, which produces about half the broilers raised in the United States.

The shortage of feed grains cut back broiler production sharply in 1944 in all regions except the Southern, where the number produced was about the same as 1943.

TURKEYS

Turkey production changed little during the first 2 war years. In late 1942 and in 1943, the number of turkeys raised was slightly less than in 1941. A record turkey crop was produced in 1944, about 10 percent arger than in 1941 and about 5 percent above the previous record set in 1940. The 1944 turkey crop was about 20 percent larger than the 1936-40 average. Indications are that the number of turkeys raised in 1945 will be 8 percent greater than in 1944.

In the Western Region, raising about a third of all the turkeys in the United States, 1944 production was up about 17 percent above 1941. The largest relative increase, 25 percent, was in the Northeast Region. Production was up about 6 percent in the North Central Region, which produces about as many turkeys as does the Western Region. The 1944 turkey production was about 7 percent above the 1941 production in the East Central Region and remained about the same in the Southern Region.

SHEEP

Wartime demands for meat have provided means for an orderly decline in sheep numbers from the 1942 all-time peak of nearly 57 million head. On January 1, 1944, there were not quite 52 million head of sheep in the United States—about 5 percent fewer than at the beginning of 1941. The January 1, 1945, number of 48 million sheep indicates that a reduction of 8 percent occurred during 1944.

It may be noted that while the total number of sheep has declined steadily during war years, the number of sheep and lambs in feed lots January 1, 1945, was slightly above 1944.

HORSES AND MULES

Official records show that the number of horses and mules in the United States reached its peak of 26,723,000 head in 1918. Since then, their numbers have declined gradually. By 1941 there were only 14,136,000 head in the country, and the number has continued to fall at the rate of about 3 percent a year. During the war, the greatest decrease has been in the North Central Region. The shift from horses and mules to mechanical power has made more feed available for milk, egg, and meat production.

FEED-GRAIN PRODUCTION

Feed grain production during the first 3 years of the war failed to keep pace with increased livestock and poultry production. While the number of grain-consuming animal units on American farms in 1943-44 was 23 percent greater than in 1940-41, the production of feed grains in 1943 was only 15 percent above the 1940 production.

Areas normally classed as feed-deficit areas increased livestock and poultry production sharply, but grew only slightly more feed grain than before the war.

The Northeast Region, which normally imports 40 percent of its feed grains from the Corn Belt, produced only 8.5 percent more feed grains in 1942 than in 1940. In 1943, its feed grain production was actually 20 percent less than in 1940. Yet in 1943 this region's broiler production was 53 percent and its pig crop was 68 percent greater than in 1941. The over-all number of grain-consuming animal units in this region was 14 percent greater in the 1942-43 feeding year than in 1940-41.

Similar comparisons could be made for other regions. In the East Central Region, where livestock and poultry production was about 24 percent greater in the 1942-43 feeding year than in 1940-41, feed grain production was up only about 12.5 percent. The Southern Region, with about 20 percent more livestock and poultry, produced 5 percent less feed grains.

The 1942 production of feed grains in the North Central Region, on the other hand, was 28 percent larger than in 1940. This compares with a 25 percent increase in livestock and poultry. The expansion in feed grain production in the Western Region was considerably larger than that region's increased requirements for livestock and poultry.

In 1943-44, the North Central Region produced 68.3 percent of the Nation's feed grain and 52.3 percent of the grain-consuming livestock and poultry. The Southern Region produced 11.4 percent of the feed grain and 17.5 percent of the animal units. The Western Region produced 11 percent of the feed grain and 14.7 percent of the total animal units. Owing to the large amount of livestock on ranges of the Western Region, their feed-grain-consuming animal units are considerably less than the total animal units produced in this region. The East Central Region

produced 6.7 percent of the feed grain and 9.1 percent of the animal units. The Northeast Region produced only 2.6 percent of the feed grain but 6.4 percent of the livestock and poultry.

In the above discussion, the livestock and poultry percentages were calculated on the basis of grain-consuming animal units. One milk cow constitutes a unit. Classes of livestock and poultry are converted to grain-consuming animal units by use of the following factors:

Animal	Conversion Factor
Milk cow	1.00 per head
Other cattle	.51 per head
All sheep and lambs	.027 per head
Hogs	.318 per hundredweight, live
Horses and mules	1.11 per head
Hens and pullets (egg production)	.045 per hundred eggs produced
Broilers produced	.0086 per head
Turkeys raised	.051 per head
Chickens raised	.01277 per head

EXAMPLE: 800 sheep × 0.027 = 21.6 grain consuming animal units.

SUMMARY

Total agricultural production in the United States has reached a new all-time high each year of this war, rising substantially above levels of the last war. In 1943 it was 50.6 percent greater than in 1917 and 42.4 percent greater than in 1918. Indications are that 1944 total agricultural production exceeded that of 1943 by 3 percent.

The 1943 corn crop of 3 billion bushels was 4 percent larger than that of 1917 and 24 percent larger than that of 1918, while the 1944 corn crop of 3.2 billion bushels was 6.4 percent larger than the 1943 crop.

Pork production in 1943 was 13.4 billion pounds dressed weight (excluding lard), 89.5 percent more than the 7.1 billion pounds produced in 1917 and 60.1 percent more than the 1918 production of 8.3 billion pounds. The 1944 pork production declined to 12.8 billion pounds, which was still considerably larger than any year previous to 1943.

Production of 54.2 billion eggs in 1943 exceeded the 1917 production of 27.7 billion by 95.5 percent and the 1918 production of 28 billion by 93.4 percent. The 1944 production was 54.1 billion, a slight decline from the 1943 record.

The large expansion in livestock and poultry production during this war would not have been possible without the Ever-Normal Granary built up in the years of peace. By drawing on the Ever-Normal Granary, farmers were able to meet all essential requirements for meat, dairy, and poultry products of the United States and its allies until 1945, when some shortages of meat developed. In doing this, they increased livestock and poultry numbers so much that requirements for feed grains were considerably above normal capacity to produce feed and an adjustment in livestock and poultry production was inevitable. However, the adjustment which came in hogs in 1944 was too drastic and some increase above 1944 levels is advisable to meet prospective demands in 1946, since quantities of feed grains early in 1945 were ample to feed out larger numbers of hogs than were on farms. Some adjustment has been made in chickens and eventually other cattle numbers will have to be brought into line.

The following tables reveal shifts in livestock, poultry, and feed grain production by States and areas. Detailed comparisons may be made between the levels of livestock and poultry production and the apparent capacity of each State or region to produce feed grains.

TABLES AND CHARTS

TABLES

TABLE 1.—*Feed balance with indicated amounts for feed; industrial uses, food, seed, and exports; and carry-over, United States, 1941–42—1943–44*

[Feeding year: October 1 to September 30]

1941–42

Commodity	Total supply of grains		Amount for feed		Industrial uses, food, seed, and exports		Stocks October 1 (end of year)	
	1,000 tons	*1,000 bushels*	*1,000 tons*	*1,000 bushels*	*1,000 tons*	*1,000 bushels*	*1,000 tons*	*1,000 bushels*
Corn	92,997	3,321,325	70,810	2,528,935	8,400	299,991	13,787	492,399

1. Total supply equals stocks on October 1 plus production in next season and imports during the feeding year.

TABLE 2.—*Supplemental Feeds, United States, 1941-42—1943-44*
(Feeding year: October 1 to September 30)

Supplements	1941–42	1942–43	1943–44
	1000 tons	*1000 tons*	*1000 tons*
Oilseed meals:			
Soybean cake and meal	1,770	3,013	3,234
Cottonseed cake and meal	1,821	2,077	1,794
Linseed meal	891	795	998
Peanut meal	71	109	110
Copra	70	34	35
Total	4,623	6,028	6,171
Animal Proteins:			
Tankage and meat scraps	874	882	900
Fish meal	208	187	183
Dried milk products manufactured for animal feed:			
(1) Buttermilk dried and concentrated	40	40	35
(2) Skim milk dried and concentrated	35	15	15
(3) Whey dried and concentrated	50	50	50
Other milk products fed on farms (dry equivalent):			
(1) Skim milk and buttermilk	1,450	1,400	1,300
(2) Whole milk	210	215	215
(3) Whey	150	150	150
Total	3,017	2,939	2,848
Mill Products:			
Wheat millfeeds	4,610	5,189	5,430
Rice millfeeds	125	145	138
Dried and molasses beet pulp	298	300	165
Gluten feed and meal	965	927	861
Brewers' dried grains	169	232	228
Distillers' dried grains	345	357	444
Alfalfa meal	590	680	752
Total	7,102	7,830	8,018
Miscellaneous byproduct feeds	2,000	1,600	1,600
Total supplements	16,742	18,397	18,637
